

# A Hardware-in-the-Loop Framework for Urban Mobility Scenarios within the 5G Trial in L'Aquila

*Elena Cinque, Francesco Valentini, Francesco Smarra, Fabio Franchi, Alessandro D'Innocenzo, Marco Pratesi*

University of L'Aquila, DISIM Department, L'Aquila, Italy

URSI GASS 2020, Rome, Italy, 29 August - 5 September 2020

## 5G Trial in L'Aquila

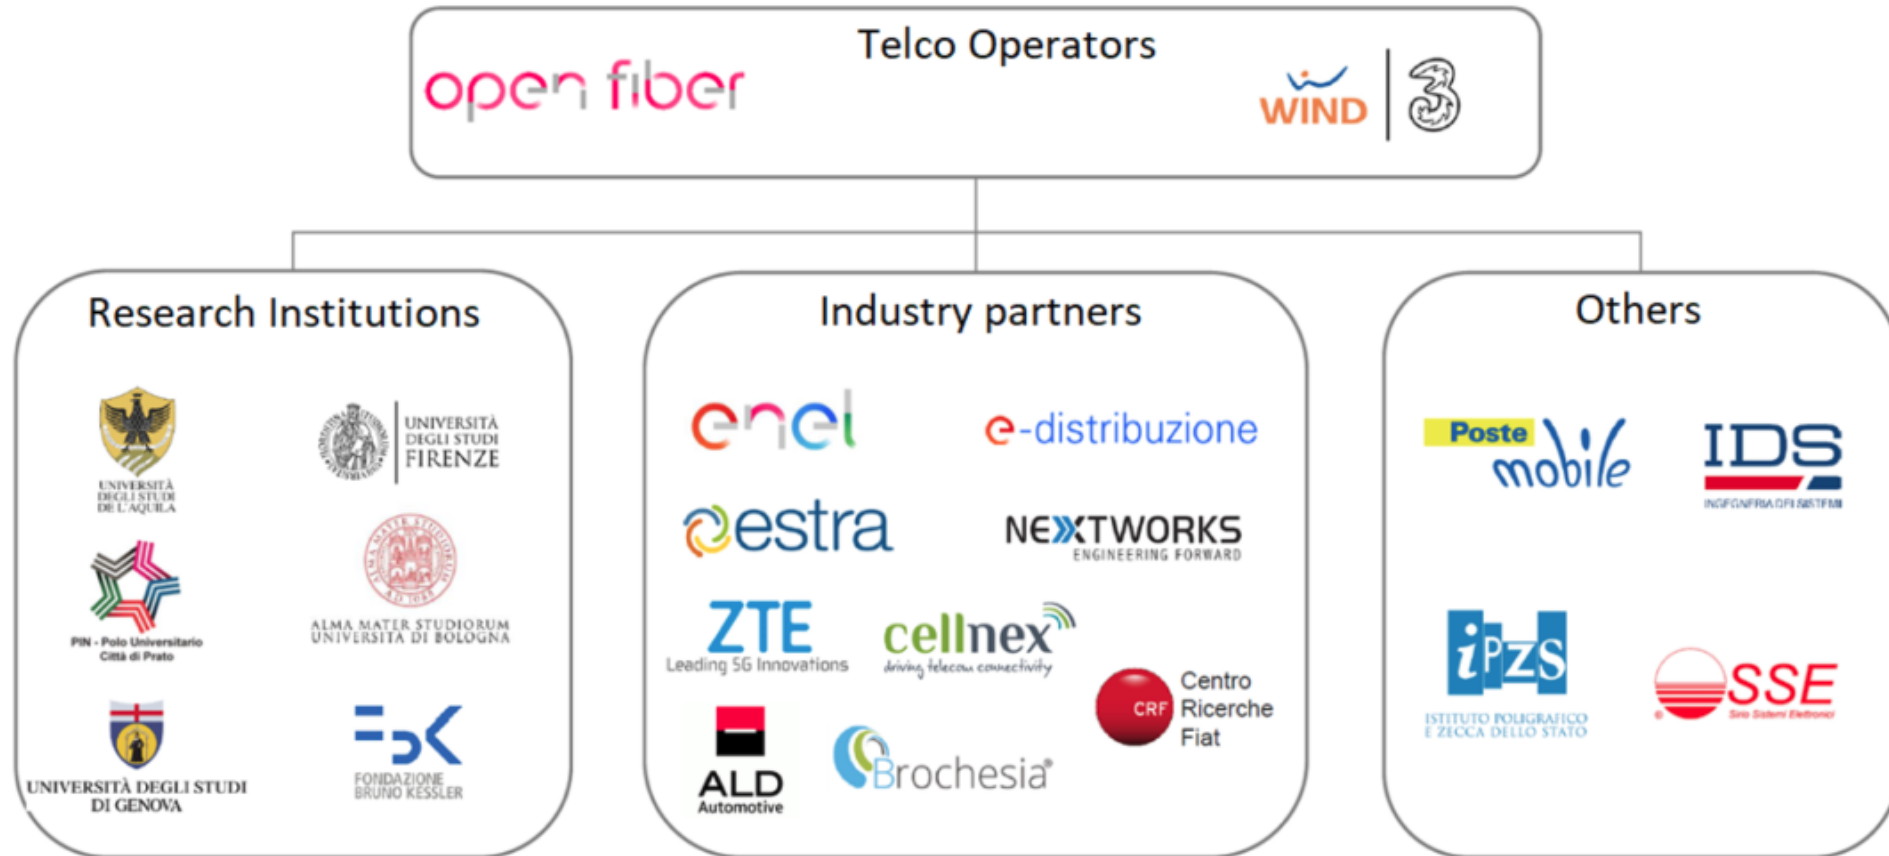

The Italian Ministry of Economic Development (MiSE) on March 2017 opened the call for project proposals for the implementation of pre-commercial experiments for the radio spectrum 3.6-3.8 Ghz.

- ▶ Area 1 - Milan - metropolitan area
- ▶ Area 2 - Prato and **L'Aquila**
- ▶ Area 3 - Bari and Matera

# The Trial Consortium

# The "5G City"

# 5G Trial: Use Cases

**UC #1: Monitoraggio Strutturale**

**UC #2: Agricoltura 2.0**

**UC #3: Realtà Virtuale e Aumentata**

**UC #4: E-Health**

**UC #5: Sicurezza**

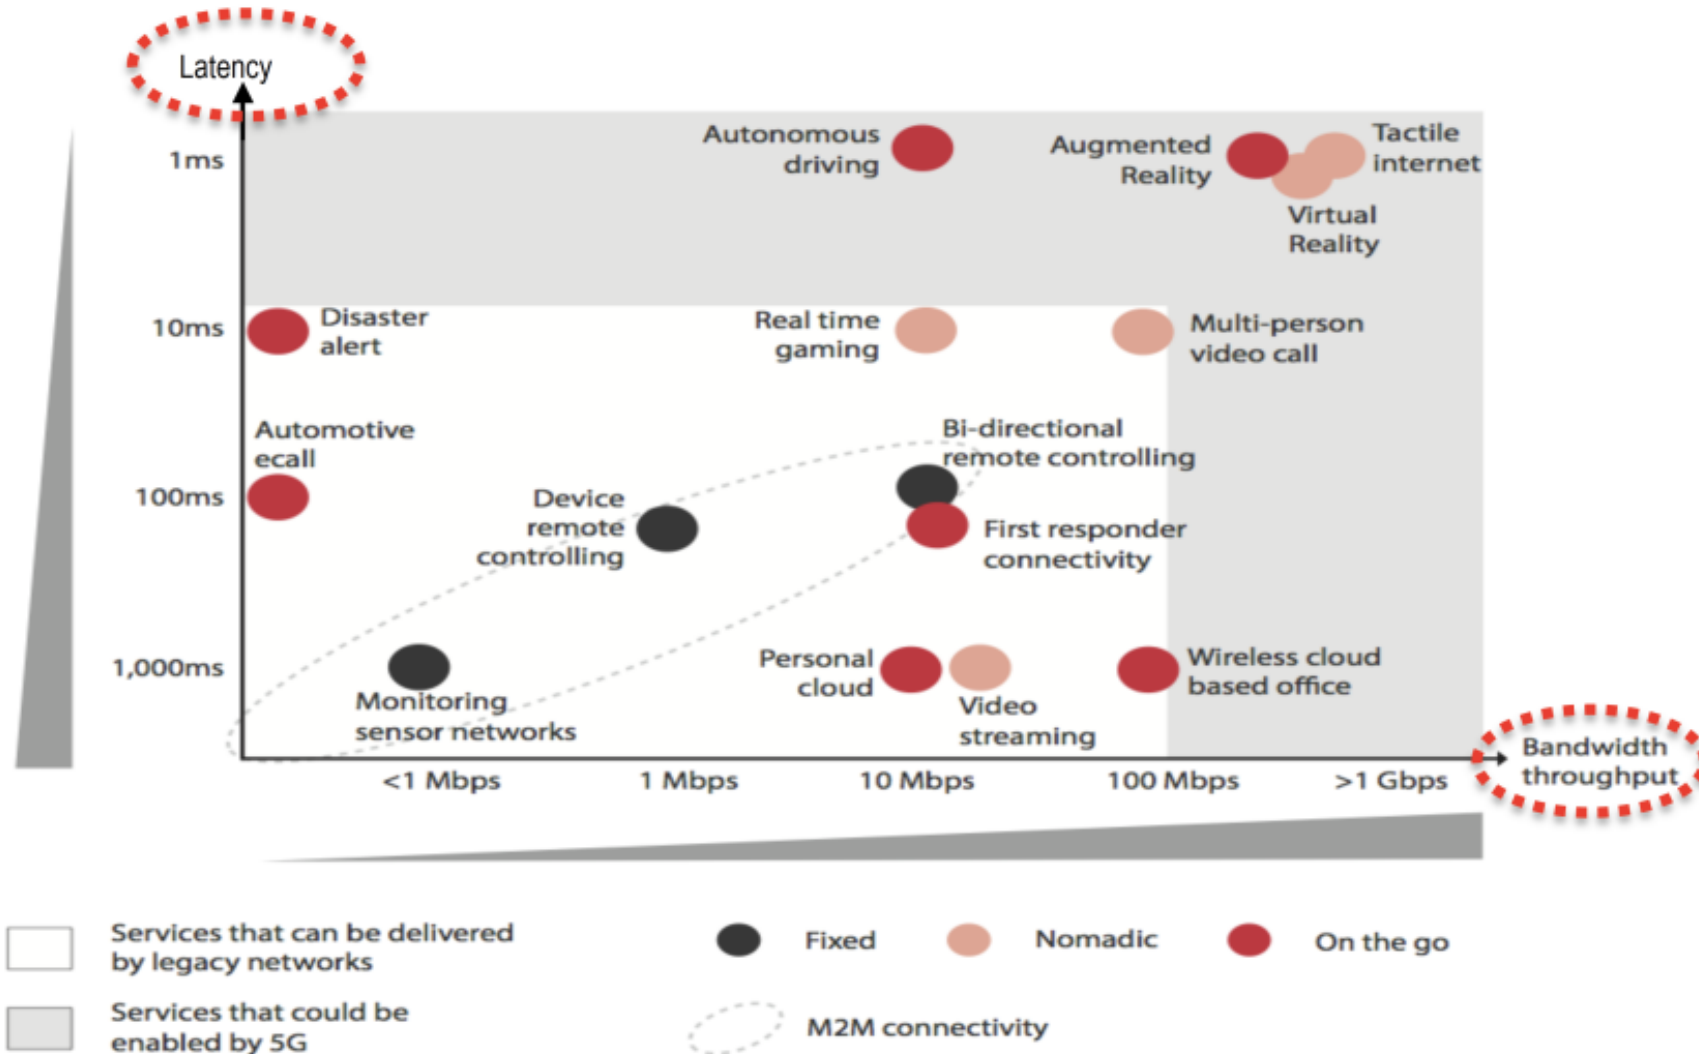

**UC #6: Veicoli connessi**

**EMERGE**

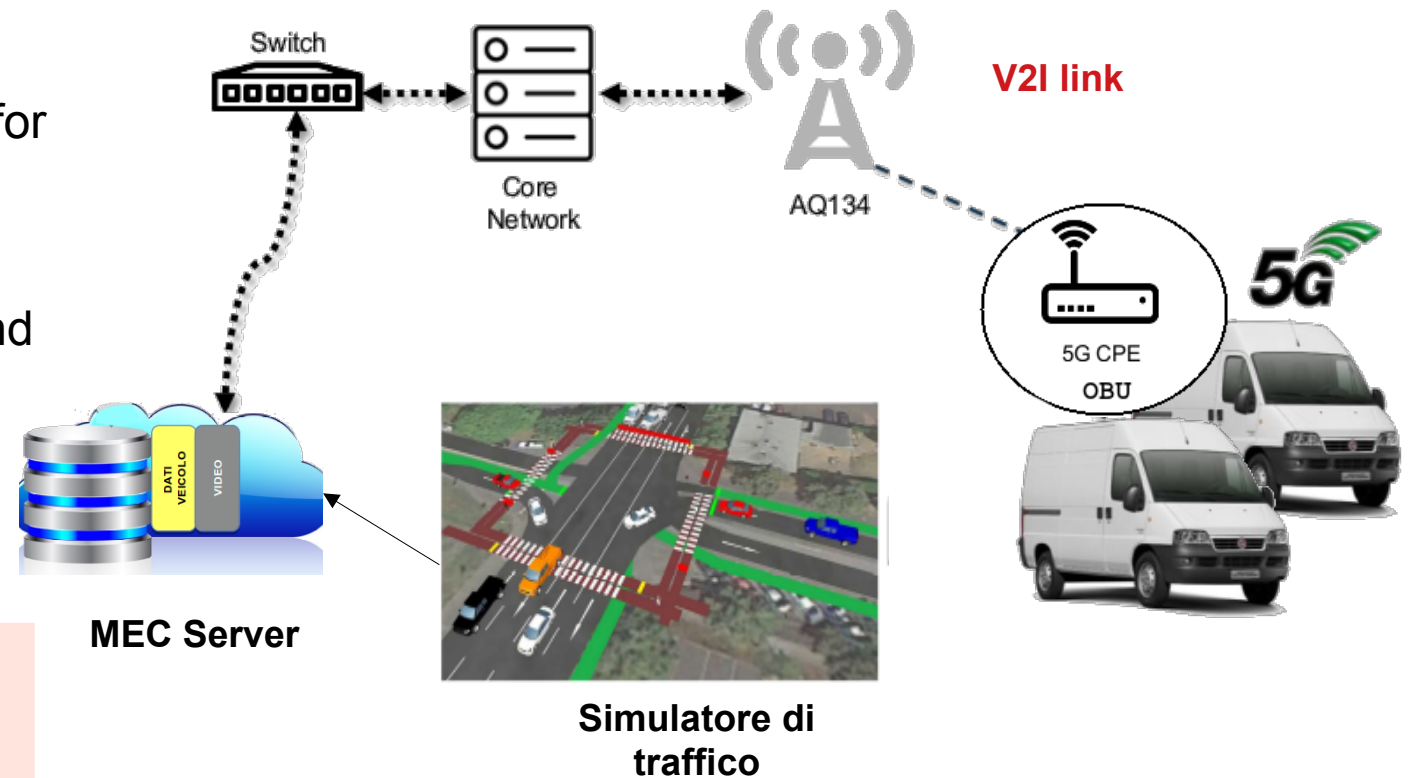

# 5G Use Cases - Overview

## 5G Smart Mobility Use Case: Goals and Architecture

- Exploitation of 5G technology for the **V2I communications**;
- real-time detection of road hazards for users safety and **dynamic maps update**;
- application of **predictive models** and **machine learning** techniques for reaction/avoidance of critical situations.

The solution implemented for the field trial relies on the integration of:

1. 5G infrastructure (provided by ZTE)
2. Central Unit (provided by CRF)
3. traffic simulator

## Hardware-in-the-loop Architecture 1/2

SUMO tool is used for the urban traffic simulation orchestrated in real-time by a **Simulation Controller** through its TraCI interface → Every 100 ms, the controller drives the simulation a step forward, **to keep the model aligned with the real time.**

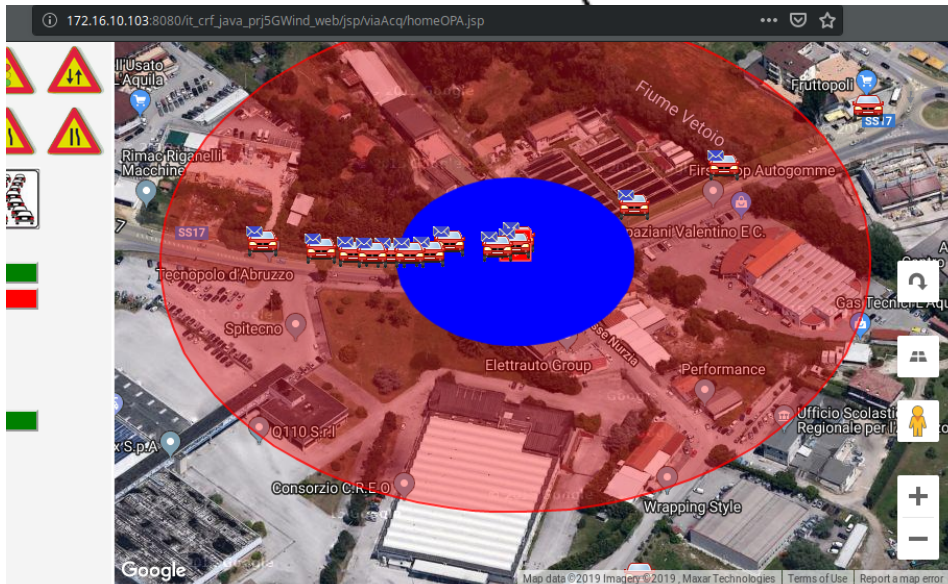

# Hardware-in-the-loop Architecture 2/2

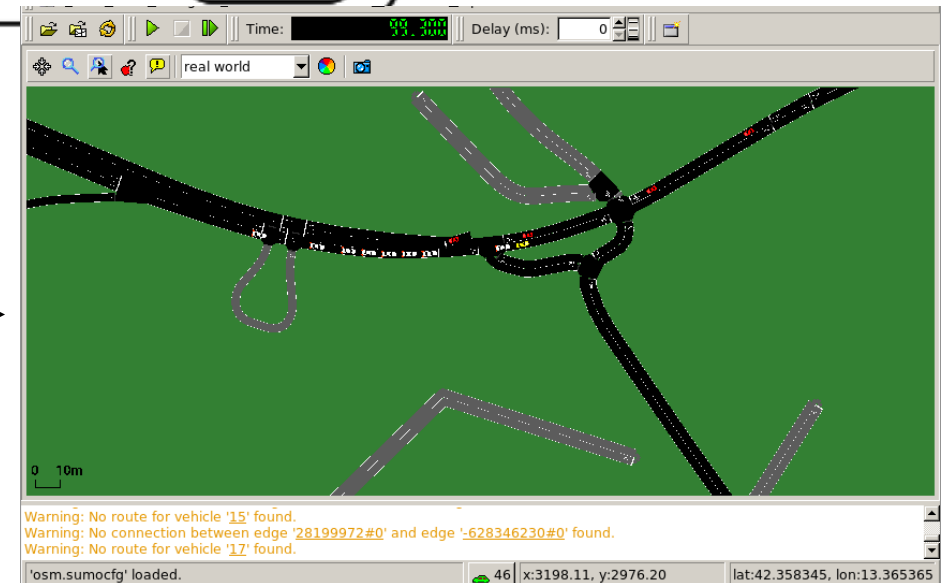

Control Center

Simulation

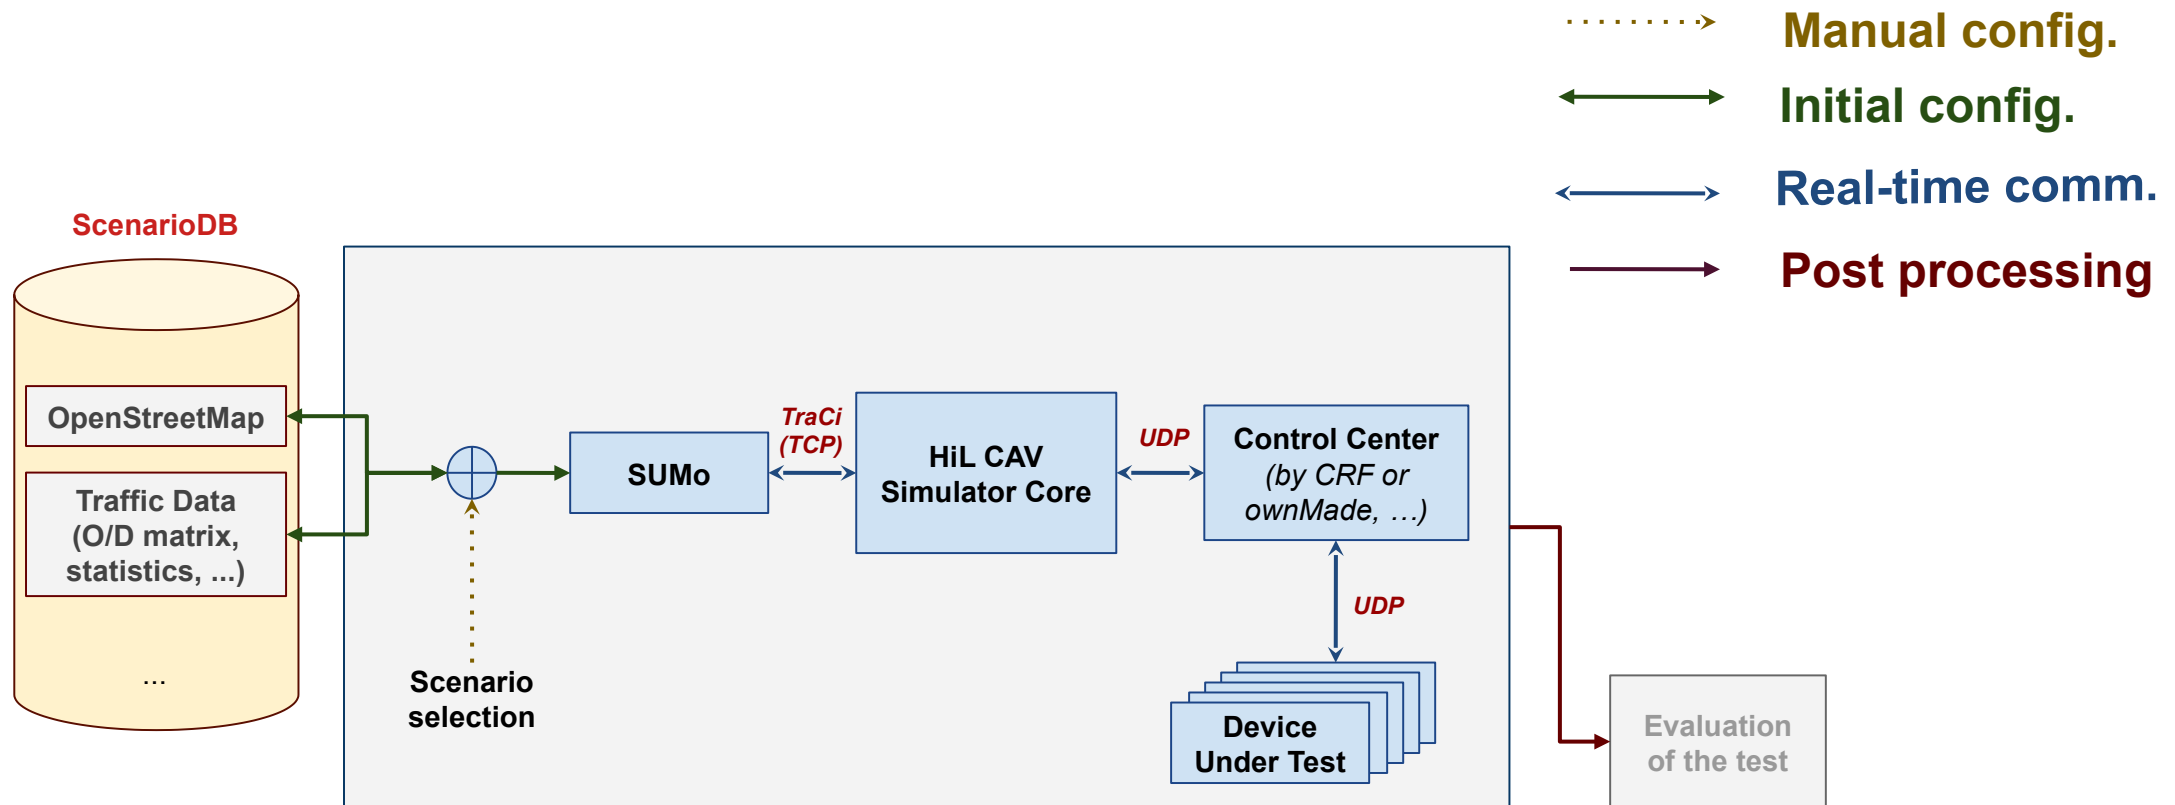

TraCI

# Hardware-in-the-Loop Framework - Overview

# Model Predictive Control: idea

*What's the best move considering  
opponent's intention?*  
***How far ahead can I look?***

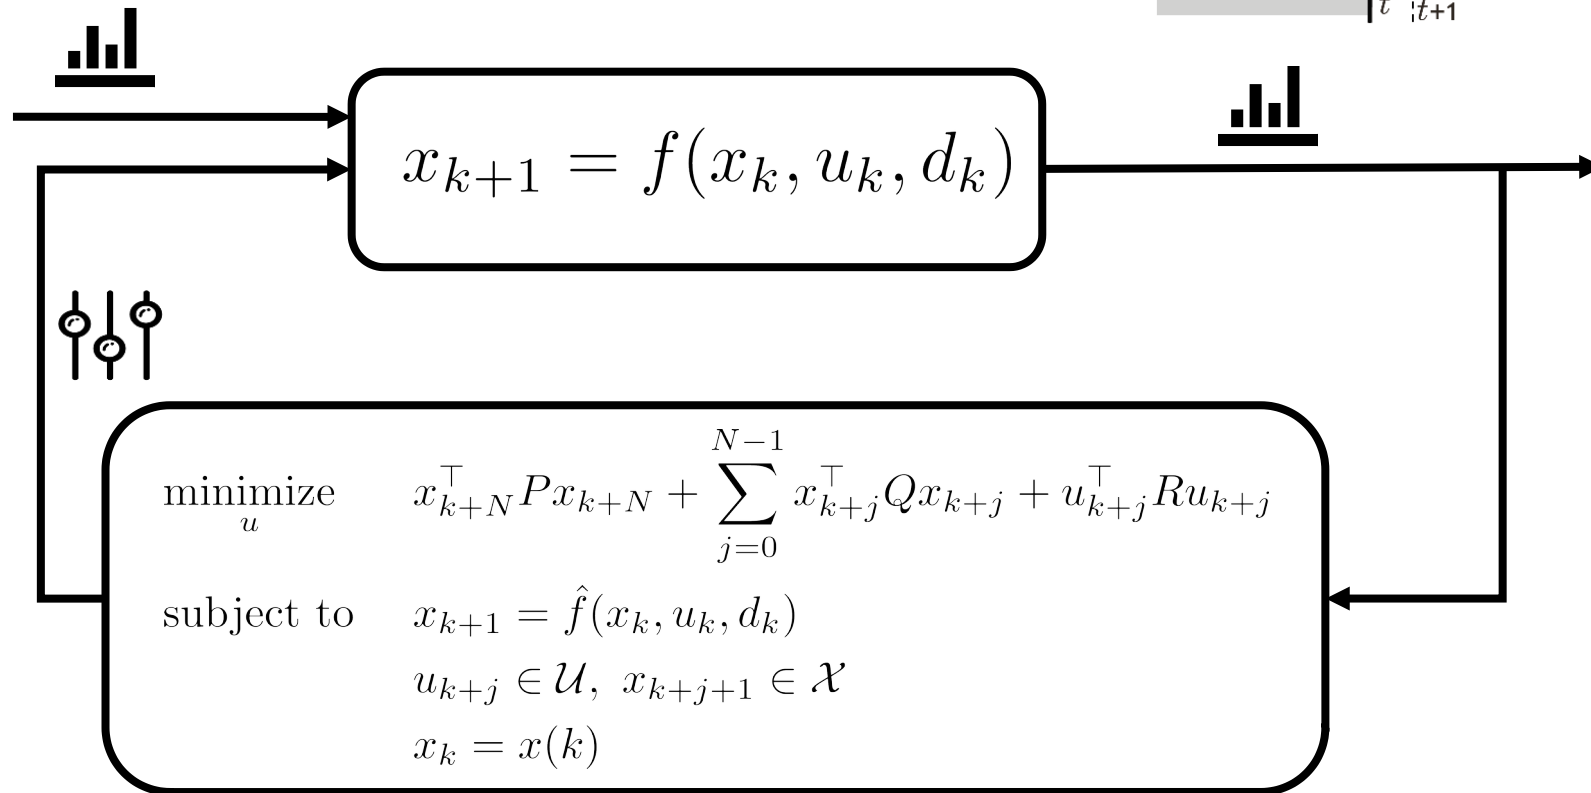

*don't crash*

*stay on the road*

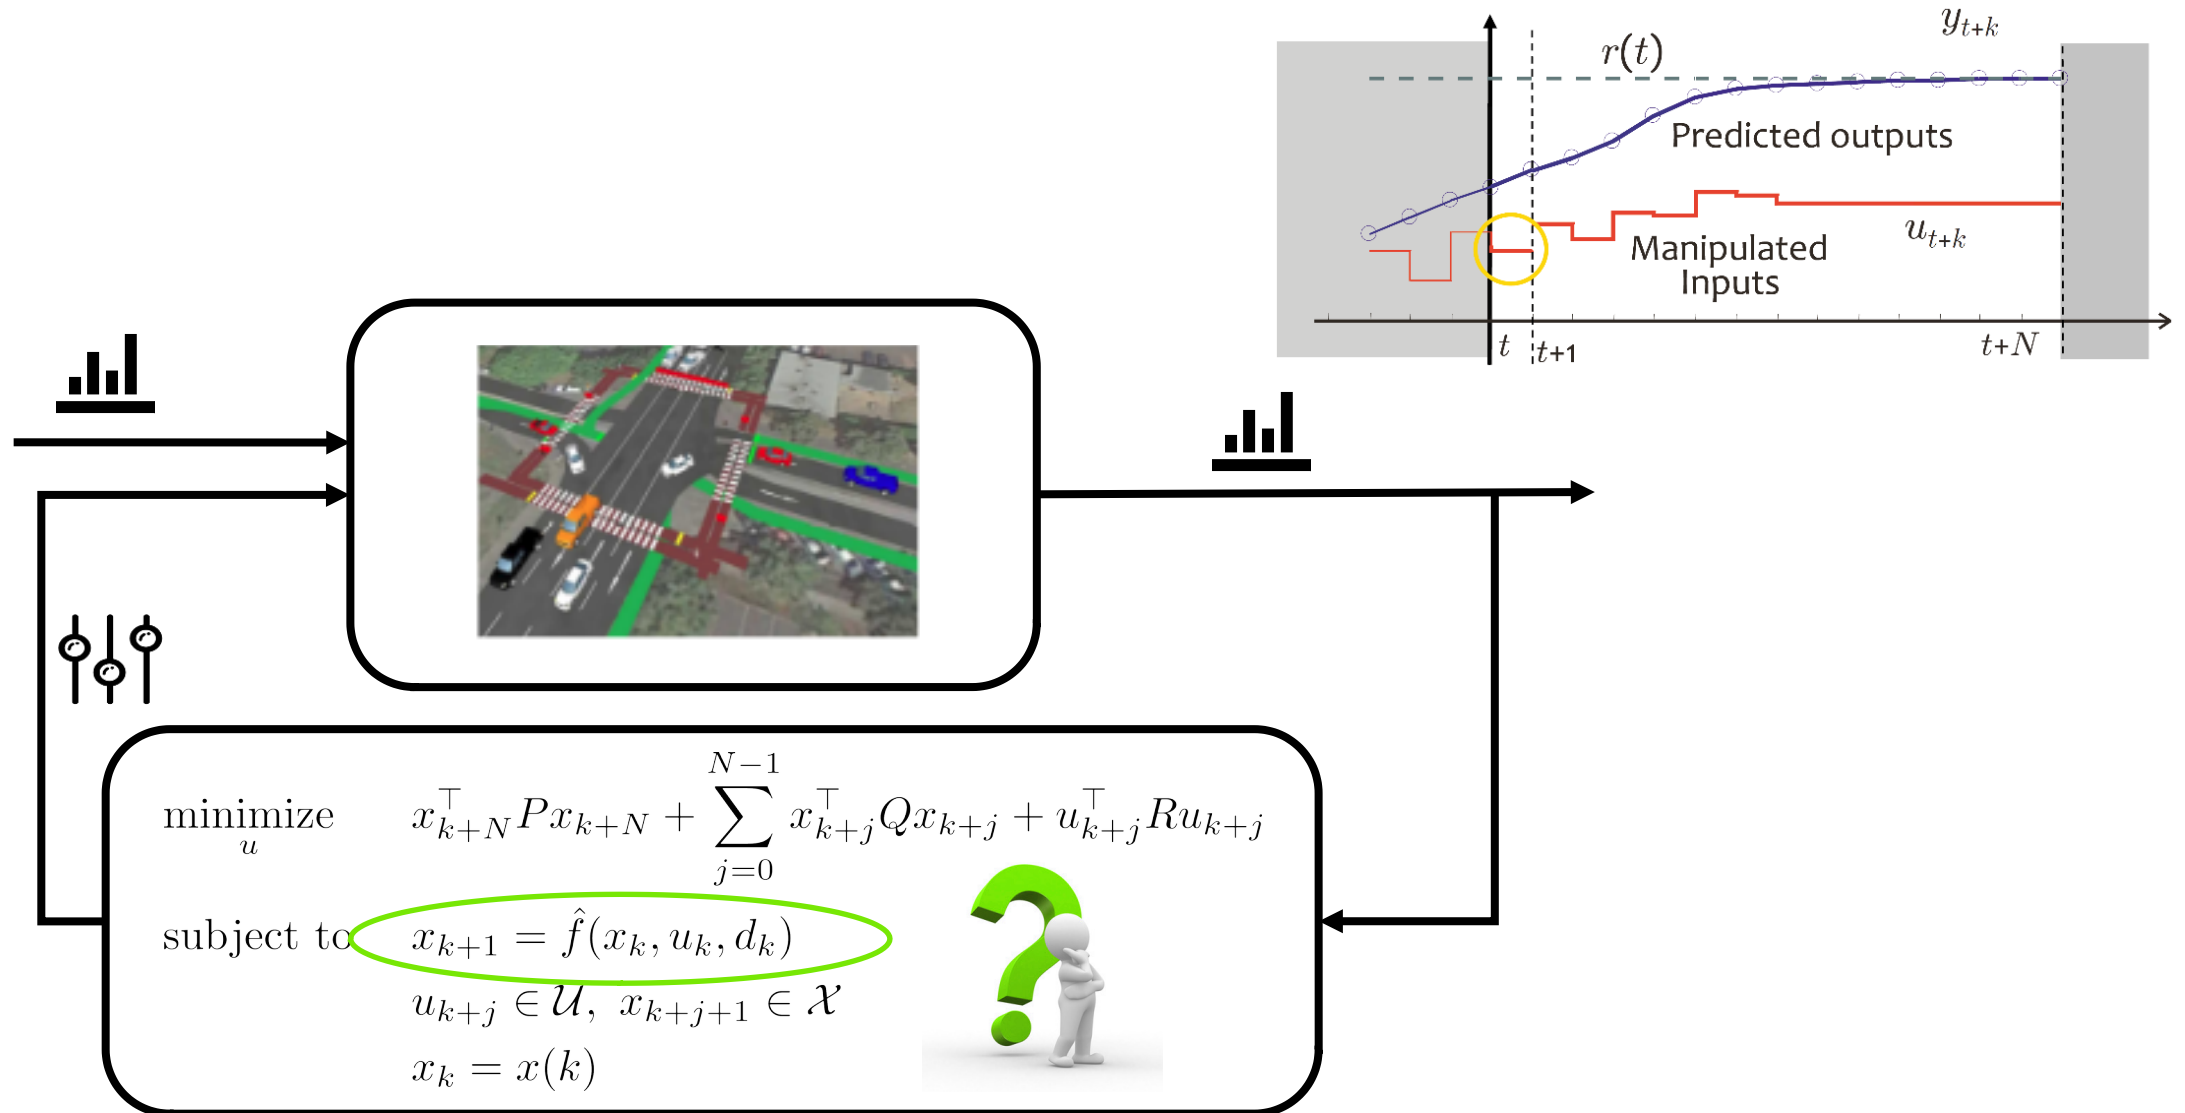

# Model Predictive Control Approach

# Model-based identification issues

# Data-driven Model Predictive Control Approach

ML techniques to fit the output prediction over a horizon of  $N$  steps as a function of the current state, of the control moves, and of the disturbances

## To sum up...

**5G MISE Trial** towards applications for C-ITSs:

- 5G based C-V2I communications to make a Central Unit (CU) constantly aware of the street-level status in a given area
- the CU is allowed to send DENM messages back to the vehicles

**The hardware-in-the-loop framework:**

- mobility simulator SUMO is exploited
- the CU is able to receive CAM messages from both real and simulated vehicles and vice-versa
- information coming from the real scenario are exploited to update the simulation environment

A **Regression Trees (RTs)-based approach** is proposed to predict critical congestion scenarios.

**Future work:** simulation techniques to implement dense scenarios with realistic mobility patterns, in order to develop and validate the proposed RTs-based strategy.
